

**(A) GENERAL**

1. These notes are applicable for the Standard Drawings for R.C.C. solid slab superstructure with and without footpaths.
2. These drawings are applicable only for right bridges with overall width of 12 m.
3. No raised footpaths shall be provided on the bridges having length less than 30m unless the same are otherwise indicated on the approaches.
4. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed. No drawing shall be scaled.

### 5. Design criteria:

- L. The design is according to the following codes:**

- (a) IRC: 5-1985  
(b) IRC: 6-1986 (1985 reprint)  
(c) IRC: 21-1987.

- ii. The following loads have been considered in the design:
- One lane of IRC class 70R or two lanes of IRC class A on cartilage way, whichever governs.
  - Footpath load of 5 kN/m for superstructure having footpaths.

2. (c) Wearing coat load of 2 kN/sq.m.

- III. The designs are applicable for 'MODERATE' AND 'SEVERE' conditions of exposure.

6. Public utility services (except water supply and sewerage), if required, shall be carried over the bridge through 150mm diameter ducts provided in the footpaths. Total load of such services shall not be more than 1.0 kN per meter on each footpath. Water/sewerage pipeline shall not be carried over any part of the superstructure. Inspection chambers in footpaths to be provided as shown in the drawing. The location and spacing of chambers along the footpath will be decided by the Engineer-in-charge in consultation with the users.

- 7. Wearing coat shall consist of the following:**

- (a) A coat of mastic asphalt 6mm thick with a prime coat over the top of the deck before the wearing coat is laid. The prime coat of mastic asphalt shall be 50% straight run 30/40 penetration grade bitumen and 50% light solvent (Benzol) to be laid over the deck slab. The insulating layer of 6mm thick mastic asphalt with 75% lime stone dust filler and 25% of 30/40 penetration grade bitumen shall be laid at 375/50 with broom over prime coat.

- (b) 50mm thick asphaltic concrete wearing coat in two layers of 25mm each as per Clause 512 of MOST's Specifications for Road and Bridge Works (Second Revision-1988)

- ii. In case of isolated bridge construction or bridges located in remote areas where provision of mastic and asphaltic concrete wearing coat is not practicable, the Engineer-in-charge may permit provision of 75mm thick cement concrete wearing coat in M30 grade concrete with maximum water cement ratio as 0.40. The reinforcement shall consist of 8mm High Yield Strength Deformed bars @ 200mm centres reducing to 100 centres in both the directions.

## (B) MATERIALS SPECIFICATIONS

## Concrete

1. Concrete shall be of design mix and shall have minimum 28 days characteristic strength on 150mm cubes for all elements of superstructure as indicated below:

Conditions of exposure	Concrete grade	Characteristic Strength
'MODERATE'	M 25	25 MPa (for 3m to 9m span)
'MODERATE'	M 30	30 MPa (for 10m span)
'SEVERE'	M 30	30 MPa (for 3m to 10m span)

2. High strength ordinary portland cement conforming to IS:8112 or ordinary portland cement conforming to IS 269 capable of achieving the required design concrete strength shall only be used.

- The minimum cement content and maximum water cement ratio in the concrete design mix shall be 310 kg/cu.m. and 0.45 respectively for 'MODERATE' conditions of exposure. The minimum cement content and maximum water cement ratio in the concrete design mix shall be 400 kg/cu.m. and 0.40 respectively for 'SEVERE' conditions of exposure.

## Reinforcement

All reinforcing bars shall be High Yield Strength Deformed bars Grade designation S 415 conforming to IS 1786.

## Water

Water to be used in concreting and curing shall conform to Clause 302.4 of IRC 21-1987.

**C) WORKMANSHIP/DETAILING**

1. Minimum clear cover to any reinforcement including stirrups shall be 50mm unless shown otherwise in the drawings.
2. For ensuring proper cover of concrete to reinforcement bars specially made polymer cover blocks shall only be used.
3. **Construction Joints**
  - i. The location and provision of construction joints shall be approved by Engineer-in-charge. The concreting operation shall be carried out continuously upto the construction joint.

- II. The concrete surface at the joint shall be brushed with a stiff brush after casting while the concrete is still fresh and this shall only happen after curing.
- III. Before new concrete is poured the surface of old concrete shall be prepared as under:
  - a) For hardened concrete, the surface shall be thoroughly cleaned to remove debris/ laitance and made rough so that 1/4 of the size of the aggregate or structurally damaging the concrete.
  - b) For partially hardened concrete, the surface shall be treated by wire brush followed by an air jet.
  - c) The old surface shall be soaked with water without leaving puddles immediately before starting concreting to prevent the absorption of water from new concrete.
- IV. New concrete shall be thoroughly compacted in the region of the joint.
4. Welding of reinforcement bars shall not be permitted.
5. Laps in reinforcement:
  - I. Minimum lap length of reinforcement shall be kept as 83 d where 'd' is the diameter of bar.
- II. Not more than 50% of reinforcement shall be lapped at any one location.
6. Bending of reinforcement bars shall be as per IS : 2502.
7. Supporting chairs of 12mm diameter shall be provided at suitable intervals as per IS : 2502.
8. Concrete shall be produced in a mechanical mixer of capacity not less than 200 liter having integral weigh-batching facility and automatic water measuring and dispensing device.
9. Proper compaction of concrete shall be ensured by use of full width screed vibrator for concrete in deck slab.
10. Properly braced steel plates shall be used as shuttering. Sharp edges of concrete shall be chamfered.

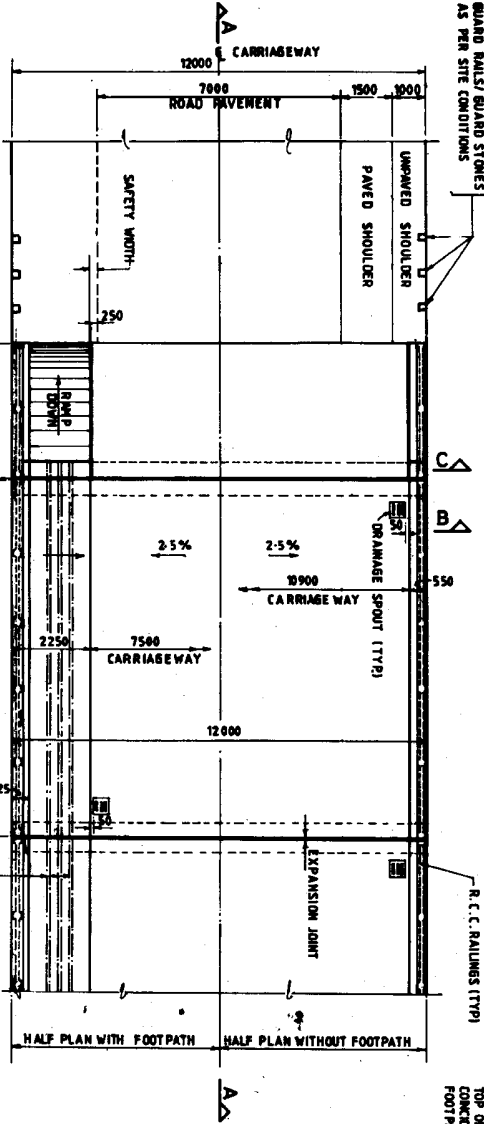

### (D) GENERAL SPECIFICATIONS

The work shall be executed in accordance with MOST's Specification for Road and Bridge Works (Second Revision, 1988) except wherever otherwise mentioned.

- NOTES:-
1. All dimensions are in millimetres unless otherwise mentioned.
  2. Only written dimensions are to be followed.
  3. Typical arrangement of drainage spouts has been shown in plan. Suitable modifications may be made by the Engineer-in-charge as per site conditions and intensity of rainfall.

**NOTES:-**

1. All dimensions are in millimetres unless otherwise mentioned. Only written dimensions are to be followed.
2. Splicing of main longitudinal bars in deck slab shall be avoided as far as practicable, in case the splicing of bars becomes unavoidable, the arrangement shall be as shown in the drawing.
3. Two of the bars spliced at any section shall not exceed 50% of the total area of the bars provided at that section.
4. Weld fabric shall conform to IS 10339. Products with L.S.I certification mark shall only be used.
5. The reinforcement of deck slab shall be suitably modified to accommodate the drainage spout. Also refer note no. 2 of drawing no. SD/H/2. The reinforcements marked 1) and 2) shall be modified in the region of inspection chamber.
6. The drainage spout shall be galvanised after welding the plates/fab.
